1 Computing For Data Analysis Week 4

1.1 The `grep()` function

What does the `grep()` function do when called with its default arguments?

It returns the indices for strings in a character that match a given regular expression.

1.2 Regular Expressions

```
^s(.*)r
```

1.3 Generic Functions

In the R system of classes and methods, what is a generic function?

1.4 S4 Methods

What function is used to obtain the function body for an S4 method function?

Not `getS3method()`.

What does the `setOldClass` function do?
